

CYBER SECURITY

is everyone's
responsibility..

**PROTECT YOUR INFORMATION
ATHOME AND AT WORK!**

Who is a Cyber Security Expert?

As data breaches, hacking, and cybercrime reach new heights, companies are increasingly relying on Cyber Security experts to identify potential threats and protect valuable data. It makes sense that the Cyber Security market is expected to grow from \$152 billion in 2018 to \$248 billion by 2023.

So what do Cyber Security experts do? On any given day, they:

- Find, test, and repair weaknesses within a company's infrastructure.
- Monitor systems for malicious content
- Identify network breaches
- Install regular software updates, firewalls, and antivirus protection
- Strengthen areas where attacks may have occurred

They work in one or more of these common Cyber Security domains to keep data safe:

- Asset security: Analyze networks, computers, routers, and wireless access points
- Security architecture and engineering: Standardize security policies and procedures
- Communication and network security: Regulate cloud storage and data transfer
- Identity and access management: Track user authentication and accountability
- Security operations: Monitor security to identify attacks
- Security assessment and testing: Test security policies to ensure compliance with industry standards
- Software development security: Create and repeatedly test code
- Security and risk management: Identify potential risks and implement appropriate security controls

Cyber Security experts employ different tactics to secure computer systems and networks. Some of the best practices include:

- Using two-way authentication
- Securing passwords
- Installing regular updates
- Running antivirus software
- Using firewalls to disable unwanted services
- Avoiding phishing scams
- Employing cryptography, or encryption
- Securing domain name servers, or DNS
